

Assignment 2: Coding Basics

Sara Sayed

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on coding basics.

Directions

1. Change “Student Name” on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your first and last name into the file name (e.g., “FirstLast_A02_CodingBasics.Rmd”) prior to submission.

Basics Day 1

1. Generate a sequence of numbers from one to 100, increasing by fours. Assign this sequence a name.
2. Compute the mean and median of this sequence.
3. Ask R to determine whether the mean is greater than the median.
4. Insert comments in your code to describe what you are doing.

```
#1. I am creting a sequence of numbers that goes from 1 to 100 in increments of 4 then I set the create  
seq(1, 100, 4)
```

```
## [1] 1 5 9 13 17 21 25 29 33 37 41 45 49 53 57 61 65 69 73 77 81 85 89 93 97
```

```
Number_Seq<- seq(1,100,4)
```

```
#2. I want to see the summary statistics of this sequence are so I use the mean and median function to  
Mean <- mean(Number_Seq)  
Mean
```

```
## [1] 49
```

```
Median <-median(Number_Seq)  
Median
```

```
## [1] 49
```

```
#3. I want to see if the mean is greater than the median so I write a code asking if the mean > median,  
Mean > Median
```

```
## [1] FALSE
```

Basics Day 2

5. Create a series of vectors, each with four components, consisting of (a) names of students, (b) test scores out of a total 100 points, and (c) whether or not they have passed the test (TRUE or FALSE)

with a passing grade of 50.

6. Label each vector with a comment on what type of vector it is.
7. Combine each of the vectors into a data frame. Assign the data frame an informative name.
8. Label the columns of your data frame with informative titles.

#5.

```
Vector_A <- c("Nora", "Jack", "Peter", "Kara", "Nate", "Jenna")
Vector_A
```

```
## [1] "Nora" "Jack" "Peter" "Kara" "Nate" "Jenna"
```

#Vector A is a list of students

```
Vector_B <- c(90,40,77,85, 30, 50)
Vector_B
```

```
## [1] 90 40 77 85 30 50
```

#Vector B is the test score of each student

```
Vector_C <- c("True", "False", "True", "True", "False", "False")
Vector_C
```

```
## [1] "True" "False" "True" "True" "False" "False"
```

#Vector C states whether each student has passed or not

#7.

```
student_summary <- data.frame("Student Name" = Vector_A, "Student Grade" = Vector_B,
                              "Passed?" = Vector_C)
student_summary
```

```
##   Student.Name Student.Grade Passed.
## 1      Nora           90      True
## 2      Jack           40     False
## 3     Peter           77      True
## 4      Kara           85      True
## 5      Nate           30     False
## 6     Jenna           50     False
```

9. QUESTION: How is this data frame different from a matrix?

Answer: This is a data frame because it includes more than one type of data. A matrix can only contain one type of data.

10. Create a function with an if/else statement. Your function should determine whether a test score is a passing grade of 50 or above (TRUE or FALSE). You will need to choose either the `if` and `else` statements or the `ifelse` statement. Hint: Use `print`, not `return`. The name of your function should be informative.
11. Apply your function to the vector with test scores that you created in number 5.

#10. Created an ifelse statement to determine if a student passed or failed based on their test results

```
str(student_summary)
```

```
## 'data.frame':   6 obs. of  3 variables:
## $ Student.Name : chr  "Nora" "Jack" "Peter" "Kara" ...
## $ Student.Grade: num  90 40 77 85 30 50
## $ Passed.      : chr  "True" "False" "True" "True" ...
```

```
student_summary$Result<- ifelse (student_summary$"Student.Grade">50, "Pass", "Fail")
print(student_summary)
```

```
## Student.Name Student.Grade Passed. Result
## 1      Nora      90      True    Pass
## 2      Jack      40     False   Fail
## 3     Peter      77      True    Pass
## 4      Kara      85      True    Pass
## 5      Nate      30     False   Fail
## 6     Jenna      50     False   Fail
```

#11 I selected the print function to show the dataframe with the newly appended Result column in the data

```
print(student_summary)
```

```
## Student.Name Student.Grade Passed. Result
## 1      Nora      90      True    Pass
## 2      Jack      40     False   Fail
## 3     Peter      77      True    Pass
## 4      Kara      85      True    Pass
## 5      Nate      30     False   Fail
## 6     Jenna      50     False   Fail
```

12. QUESTION: Which option of if and else vs. ifelse worked? Why?

Answer: I think both options worked because in order to run for the student to pass they needed a 50 (part of the if statement) and if their score was less than 50 then they failed.
